- Selected Problem Statement: **Mobile-First Ambient AI Scribe with Real-Time FHIR Conversion**
- About Solution: We use real time multi-lingual Hinglish (Hindi + English) transcribing while providing detailed documentation and FHIR conversion for further processing.
- Different Use of AI: Highlight the AI (API form) or AI (fine-tuned or trained) :
Sarvam API,
Supabase,
Railway
Gemini
- Technology stack: Javascript, python, CSS, PostgreSQL
- Backend logics and Data structure:
Real-time WebSocket pipeline: Browser mic → Sarvam AI STT (Hindi-English code-mixed) → Gemini 2.5 Flash structured clinical extraction → FHIR R4 Bundle with security + database management + admin dashboard for monitoring purposes.
- The solution economics (cost and scalability):

Sarvam AI STT at ₹0.50/min (~\$0.006) for native Hindi-English code-mixing
+
Gemini Flash at ~\$0.002/extraction
=
Total under ₹1.50 per consultation (~\$0.02).

Workers can be scaled horizontally = 10,000 consultations/day costs < ₹15,000/month.
- Explain solution in workflow:
Doctor taps record → speaks naturally in Hindi-English → Sarvam AI transcribes code-mixed speech in real-time → Gemini extracts structured clinical note + FHIR resources + differential diagnosis, giving entire workflow under 30 seconds per consultation.
- Demo url: <https://medscribe-ai-production-851f.up.railway.app/>
- Innovation: Ambient scribe purpose-built for India, Sarvam AI for native Hindi-English code-mixing STT, Indian brand drug mapping (Crocina→Paracetamol)
